- Programming languages and software engineering

Current Research

I am currently a Research Assistant at UIUC advised by Sasa Misailovic. My current projects include:

- **State uncertainty estimation for autonomous vehicles:** Modern autonomous vehicles use neural networks to perceive their state and/or make control decisions. Consequently, such vehicles operate on approximate data and may make unsafe decisions. Using a novel perception model and generalized polynomial chaos, we estimate the uncertainty in the vehicle state over time, and provide useful safety guarantees.
- **Precise analysis of program uncertainty in the face of SDCs:** Silent Data Corruptions (SDCs) alter program data in an insidious manner. `gem5-Approxilyzer`, a tool for analysis of programs in the presence of SDCs, does not scale to large programs or inputs. We combine `gem5-Approxilyzer` with `Chisel` and `Diamont`, respectively static and dynamic analyses of program uncertainty. This combines the precision of `gem5-Approxilyzer`'s analysis with the scalability of `Chisel` and `Diamont`.
